Report for **phd.bib**

Your database was read and has the following general characteristics:

- total publications: 347
- ignored entries: 3
- number of authors: 449

Network analysis

The paper network is built by connecting papers that share authors. If *paper A* shares an author with *paper B* and *paper B* shares an author with *paper C*, then *A*,*B* and *C* are in a connected component. **These components might show communities of researchers.**

- The largest connected component has 139 papers, all these papers are connected via people authoring more than one paper.
    - One element of that component is:

`bentley2014mappingcollectivebehaviorinthebigdataera`

- 108 papers of your research don't share authors with any other paper.

Figure 1: Publications per year (total and of largest component)
